Humidity
As wood is a natural fiber, changes in the level of humidity of the room, in which you have installed your hardwood floor, will cause it to shrink or expand. Shrinkage and expansion is normal and will not harm your floor as long as the humidity level is kept at a normalized level (between 40% and 60%). This can be easily accomplished through the use of an appropriate ventilation and humidification system.

Unload in Dry Weather never unload in rain, sleet or snow. Engineered flooring should be stored in a Climate-controlled well ventilated building. Ensure that the relative humidity is within the warranty range of 40-60% humidity and at a Temperature of 60-80 F (16-27 C) for 14 days prior and is maintained during and after installation.

Appalachian Engineered Flooring may be installed on grade, above grade as well as below grade where conditions meet requirements as outlined in this guide and in the Appalachian Engineered flooring limited warranty.

Crawl space earth (or thin concrete slab) should be covered 100 percent by a vapour retarder of black polyethylene (minimum 6 mil) or any recommended Class C puncture-resistant membrane, meeting ASTM D-1745.

Sunlight
The color of your hardwood floor will mature with time and exposure to sunlight and this will cause it to change color. Any area rug will block out light and should therefore be shifted on a regular basis to keep the color of your floor more uniform.

Liquids and spills
All liquids and spills should be wiped off as soon as possible in order to prevent any possible damage. You may consider using area rugs to protect susceptible areas (around kitchen sink, at exterior entrances etc.). Please do not wet mop your floor. Standing water can harm or warp your floor.

Protection
Abrasive dirt such as sand, street dirt and cat litter can damage any hardwood floor regardless of the strength of the finish. However you can help protect your floor by using entrance mats and area rugs in high-risk areas such at entrances and doorways. Regular cleaning or vacuuming of these rugs will prevent accumulation of dirt and thus keep it off your floor. The same logic applies to furniture. Not only should felt pads be placed under the legs of the furniture standing on your floor but the felt pads should be cleaned regularly in order to reduce the risk of damaging your floor. High heels with narrow points should also be avoided on your floor. The tremendous pressure exerted by the tip can dent and scratch the surface.

Care and Cleaning
PLEASE READ SEPARATE CARE AND MAINTENANCE GUIDE FOR MORE DETAILS ON WEB SITE.
Your pre-finished Appalachian Flooring ltd. Hardwood Floor is easy to clean and maintain. We recommend that you regularly dry-mop and vacuum your floor to avoid the accumulation of grit and dust on the surface. Any conditioning or stain removal from your floor should be performed using products specially formulated for use on prefinished hardwood floors. This will ensure that they do not compromise the quality of your finish. Using general household cleaners on your pre-finished floor may have a negative impact on the look and strength of your floor’s finish and void the manufacturer’s warranty. Do not use wax, oil based detergents or other household cleaners as they may dull or damage finish and leave a greasy film that makes the floor slippery. Any hardwood flooring cleaner used must be specified for use on prefinished hardwood floors. If you have any additional questions about the use of certain products or the general care and maintenance procedures applicable for hardwood floors do not hesitate to ask your local Authorized Appalachian Flooring Dealer.
Prior to Installation

- Inspect all door casings and wall molding. Where necessary cut the moldings to allow the wood flooring to slide beneath them. This can be done with a jamb saw or by placing a piece of flooring (face down) next to the molding. Using a carpenter’s saw laying flat on the flooring saw through the casing. Remove the waste material and sweep away all debris.

- Use a utility knife to scribe along the top edge of the base moldings before removing to prevent tearing paint or drywall
- Remove all existing base molding, door casing etc.
- Plan the layout for the best visual appearance of the finished wood floor.

- Temperature of 60-80 F (16-27 C) and humidity 35-55% for 14 days prior and maintained during and after installation.
- Basements and crawl spaces must be well ventilated. Crawl space should have 1.5% of open venting per 1,000 s/f (92.90 sq. meters) of floor area. Vents must be properly located to foster cross ventilation.
- Direct Drainage away from Building
- **Insulate over heating and un-insulated heat ducts by using a double layer of 15 lb or single layer of 30 lb asphalt felt paper**
- **Acclimate Stock** Engineered flooring must be acclimated for 48 hours
- Ensure that customer approves the color and layout before installation begins.
- If installing on a subfloor over joists, verify joist orientation prior to beginning. Flooring should be laid perpendicular to the floor joists for greater stability.
- Our installation instructions take precedence over NWFA installation guidelines. However in situations not specifically covered by our installation guide NWFA guidelines are recommended.

### Tools
- Hammer or rubber Mallet
- Measuring Tape
- Utility Knife
- Tapping Block
- Chalk Line
- Straight Edge
- Carpenter Square
- Pencil
- Moisture Meter
- Pry Bar
- Pull Bar
- Drill Bar
- Hand saw, table saw, Circular saw or band saw
- Undercut saw for door jams if necessary
- Air Compressor and hose
- Recommended flooring stapler/nailer
- 100-150 lb (45-69kg) roller
- Scraper
- Leveling Compound
- Leveling bar
- Level

### Supplies
- 2" Concrete nails and 1"x 3" x 8" latte for first row holding back
- 3m blue tape
- Premium Wood Glue (PVA carpenters glue)
- ⅛ – ⅝ fasteners
- Moldings, reducers, stair nosings
- #20 grit sandpaper
- 6-d finish nails or pneumatic finish nailer and pneumatic finish nailer 1 ⅛ – 1½ fasteners

### Underlay
- Underlayment or Acoustic Underlayment pad
- Felt Paper or Moisture barrier
- Moisture Retardant

### Cleaning
- Broom or Vacuum
- Hardwood Floor Cleaner
- Towel for cleaning tools
- Bostik Ultimate adhesive cleaner

### Safety
- Safety glasses
- Dust Mask
Subfloors

Wood Sub floors
1. The floor must be level. Level is within 3/16” in 10’ (5mm in 3m) and/or 1/8” in 6” (3mm in 2m)
2. Minimum of ¾ inch thick plywood. Ensure that no creaking, loose edges, sags etc exist. Repair them as Necessary before starting installation
3. The panels can be laid on the diagonal or perpendicular with the joists, with 1/8” spacing between panels
4. Fasten panels down at least every 6” to form a minimum grid pattern
5. OSB must be APA rated and maintained in a controlled environment
6. Wood subfloors should not exceed 12% and there should result in less than a 4% humidity difference between the flooring and the wood sub flooring material. If the subfloor has excessive moisture postpone installation, find the moisture source and correct by raising the heat and increasing ventilation until proper conditions are met or apply suitable moisture retardant or use an underlayment that also acts as a vapor retardant.

Installing over an existing floor

Vinyl sheet and VCT Tile
Make sure that all tiles or sheets are firmly secure. When gluing to vinyl abrade surface for greater adhesion. Do not glue on heavily cushioned or rubber tile

Ceramic Tile
Make sure all tiles are bonded to the subfloor. If necessary repair tile to ensure that sufficient adhesion is present. Allow the repair to dry before applying adhesion. Roughen the surface with a terrazzo grinder or open 40 grit sandpaper. Clean dust created by sanding.

Concrete

Moisture
Before testing a Concrete slab for moisture it should be cured for 45-90 days with a minimum of 30-60 days drying time before installing wood flooring and a Moisture test completed on the slab
1. TYPE ONE TEST One test per 200/sf (2 minimum test per jobsite. 2 ft by 2 ft pieces of 6 mill poly ethylene film (polyfilm) and secure them in different places on the floor with duct tape. After two days see if the plastic has any fog, dampness or cloudiness or changes in color. If it does, have it corrected prior to installation or use the appropriate moisture barrier
2. TYPE TWO TEST One test per 200 s/f (minimum 2 tests per jobsite) Chip small section of concrete off floor and apply 3% phenolphthalein in alcohol solution (available at most druggists) in the area. Red color indicates moisture. ALWAYS chip concrete as this protects against the possibility that a concrete sealer was applied. IMPORTANT: Keep Phenolphthalein out of direct sunlight. Average shelf life of Phenolphthalein is six (6) months.

3. TYPE THREE TEST CALCIUM CHLORIDE

TEST * One test per 1,000 s/f for 24 hours. Instructions per Test Kit: The surface where the test patch is to be placed must be brushed clean to remove any waxes, surface sealers, dust, dirt, oils or other surface contaminant’s. At the time the test is conducted, the temperature of the floor and the surrounding area should be at least 65 degrees Fahrenheit. Leaving no gaps, apply the sealant tape completely around the perimeter of the plastic cover. Remove the lid from the plastic dish containing the calcium chloride and, being careful not to spill any of the calcium chloride, place the dish on the floor (remember to save the tape to reseal the lid to the cylindrical dish after the test is concluded). Immediately place the plastic cover over the calcium chloride dish and press the cover firmly to the floor making certain that the sealant gives an airtight seal around the plastic cover.

Leave the test undisturbed for the time prescribed in the test kit instructions. Note the date and exact time the test was started on the dish label. At the end of the prescribed time, remove the cover and reseal the lid to the dish again being sure that none of the calcium chloride is spilled. Note the date and exact time the test was concluded on the label. The test is then sent to a laboratory and documentation will be returned, (See manufacturers instructions on Calcium Chloride kits). Or you can purchase a scale and do the measurements in house. Calcium Chloride kits are generally available through your distributor

RESULTS INDICATES
0-3 lbs dry*
over 3 lbs moisture barrier required
over 7 lbs too wet

Debris- Cleanliness
1. Concrete must be free of contaminations of materials such as paint, oil, wax, grease curing compounds etc as these can result in unsatisfactory bond of the adhesives
2. To remove the contaminates ensure that a solvent bases stripper is not used as this will effect the bond of the adhesive
3. Loose flaky concrete to be sanded with open 20 grit sandpaper
4. Prior to installation sweep or vacuum

Level
1. The floor must be level. Level is within 3/16” in 10’ (5mm in 3m) and/or 1/8” in 6” (3mm in 2m)
2. For high spots occur must be grinded level
3. For low spots they need to be filled with Portland based leveling compound PSI 3000+
4. Concrete sub floors must be smooth and free of structural defects
5. Do not install over concrete that has a compressive strength less than 2500 psi
GLUE DOWN APPLICATION

BE AWARE OF FLASH AND OPEN TIME FOR THE ADHESIVE.
Flash time is the waiting time between application of the adhesive and the installation of the wood floor. Open time is the maximum amount of time recommended for the adhesive to be exposed to the air before the installation of the wood. Open time typically range from 75 to 180 minutes depending on the substrate and conditions.

IT IS IMPORTANT TO CLEAN GLUE ON THE FLOOR
Before the installation of the wood floor. Open time typically range from 75 to 180 minutes depending on the substrate and conditions.

STEP ONE STARTING LINE
1. The floor must be level. Level is within 3/16” in 10’ (5mm in 3m) and/or 1/8” in 6” (3mm in 2m)
2. Insure that the shear strength of the glue does not exceed the strength of the adhesive. Light weight concrete (less than 3000 psi) will not be strong enough for a glue down application only for a floating application.
3. Place a mark approximately 18” from the corner of the starting walls add the width of flooring + 1/2” to allow for expansion and the tongue. Strike a chalk line through these two points the length of the room to the end lines
4. Measure the distance between the starting line and the wall the full length of the starting wall. If the wall is badly out of line (crooked) it may be necessary to rip boards to follow the irregularity in the wall.
5. Using no adhesive install a strip on the side edge (closest to the wall) of the chalk line. This row may be of any straight wood material. Make certain each of the Strip is in perfect alignment with the starting line. When satisfied, attach the board to the sub-floor using nails or concrete nails. This strip row is to minimize movement of the flooring during installation and will be removed once the floor is complete

STEP TWO SPREAD THE ADHESIVE
Read the label on the adhesive container. Using the trowel recommended by the adhesive supplier spread an area that can be covered with wood within the starting time of the adhesive (as noted on label). An average spread is an area 14-25” deep and the length of the room. For Optimum adhesive application work trowel in circular motion at 45 degree angle.

STEP THREE INSTALL THE STRIP
1. Install the first board making certain that the Tongue side is tight against the strip.
2. Insert the end of the next board into the adjoining tongue or groove and force the board tightly against the sacrificial board and the end of the adjoining first board. After three or more boards have been installed in the first row installation of the second row can begin
3. Select a board for the second row that will allow at least 6” of difference between it and the length of the board in the first row. Continue installing in this manner until three or more boards have been installed. Continue adding rows, extending each as necessary until all the the entire adhesive has been covered.
4. Avoid close alignment of joints in all rows throughout the installation, always attempting to get the maximum spacing available with a minimum of 6”. Avoid alignment of joints in opposite rows, which may create an “H” pattern in the floor. Once the first section has been completed inspect it closely, tightening all end and side gaps as necessary.
5. Clean all adhesive from the surface immediately. DO NOT wait to clean the surface until completion of the job, as the adhesive may not be removable.
6. If necessary use blue painter’s tape to hold the joints tightly together until the adhesive cures if necessary. DO NOT use masking tape.
7. Measure the final row. Rip the boards (parallel cut) to fit the final wall allowing for ⅜” expansion. Use blue painter’s tape to hold the final row in place.
8. Remove the strip row being careful to not damage the adjoining boards. Apply adhesive to the back of each board and gently press in place. Pull the boards tightly to the previously installed row and hold in place with blue painter’s tape.

STEP FOUR COMPLETION
1. Remove all tape from the floor starting from the area in which the wood was first applied. Inspect for gaps, chips and adhesive residue while removing the tape. Remove all adhesive residues, touch up chipped areas and fill with the appropriate filler as necessary. Use colored latex filler for factory finished flooring.
2. Install/reinstall all moldings
3. Vacuum floor thoroughly.
4. Use appropriate hardwood floor cleaner. NEVER WET MOP OR SPRAY CLEANER DIRECTLY ON FLOOR
   If required by the adhesive manufacturer, roll the floor with the appropriate weight roller. First use of the floor varies from one adhesive manufacturer to another. Generally the floor can have light foot traffic after the adhesive has cured for 18-24 hours with furniture being LIFTED into place after 24 hours.
5. Save a few boards in case board replacements are necessary.
FLOATING INSTALLATION

Recommended Adhesive for Floating

<table>

<td>Roberts 1406 Tongue and Groove adhesive</td>
<td></td>
<td><a href="http://www.robertsconsolidated.com">www.robertsconsolidated.com</a></td>
</tr>
</tbody>
</table>

STEP ONE UNDERLayment

1. The floor must be level. Level is within 3/16” in 10’ (5mm in 3m) and/or 1/8” in 6’ (3mm in 2m)
2. If the sub-floor is concrete install a 6-mil poly poly vapor barrier. All joints should be lapped 6” and taped with a moisture resistant tape. DO NOT install this vapor barrier over wood sub-floors.
3. Install the underlayment parallel to the starting wall and in the same direction that the Flooring will be installed. Do not overlap joints. Underlayment should be cut flush with the walls. Tape all joints using a water resistant tape such as packing tape or duct tape; allow no wrinkles. Tape the starting row to the floor to prevent movement.

STEP 2 WORKING LINE

1. Place a mark approximately 18” from the corners of the starting walls add the width of flooring + 1/2” to allow for expansion and the tongue. Strike a chalk line through these two points the length of the room to the end walls on top of the underlayment. This line is the STARTING LINE.
2. Measure the distance between the starting line and the wall the full length of the starting wall. If the wall is badly out of line (crooked) it may be necessary to rip boards to the follow the irregularity in the wall.
3. Option: Using no adhesive install a strip on the inside edge (closest to the wall) of the chalk line. This row may be of any straight wood material. Make certain each of the Strips is in perfect alignment with the starting line using wedges to hold the flooring in place on the ENDS.

STEP 3 INSTALLATION OF BOARDS

1. Select the longest boards available. Lay the boards out the length of the room. Make certain that the last and final board in the row will be at least 12” in length. The last UNCUt board must allow at least 12” between the board end and the wall. If the board in the row will need to be cut less than 12” in length to complete the row adjust the board selection accordingly.
2. Begin installation from the RIGHT corner with the tongue facing you and the long GROOVE facing the starting wall or strip row. The short end GROOVE should be facing the end wall. Align the first board with the STARTING LINE.
3. Select the second board. Place a 1/8” continuous bead of glue in the inside bottom edge of the END groove. DO NOT apply glue to the long side groove at this time Carefully interlock the joint with the first board always maintaining alignment with the STARTING LINE. Remove any excess glue from the surface with a towel.

STEP 4 COMPLETING THE JOB

1. Remove all tape from the floor starting from the area in which the wood was first applied. Inspect for gaps, chips and glue residue while removing the tape. Remove all glue residue, touch up chipped areas and fill with the appropriate filler as necessary. Use colored latex filler.
2. Install/reinstall all moldings and clean the floor with the appropriate cleaner. Use of the floor varies from one glue manufacturer to another. Generally the floor can have light foot traffic after the glue has cured for 8-24 hours. Avoid walking on the floor during installation as traffic may loosen or break glue joints.
3. First use of the floor varies from one glue manufacturer to another. Generally the floor can have light foot traffic after the glue has cured for 8-24 hours. Furniture being LIFTED into place after 24 hours.

4. Use wedges or waste material in the expansion gap on the side and end walls (ends only if sacrificial board was used) to maintain alignment with the STARTING LINE. Continue installing in this manner until the first row is complete.
5. Measure and cut to length the final board in the row allowing 1/2” expansion between the end of the board and the end wall. Select a longer board for this cut, as the material left over will be used as a starter board later. Apply glue in the groove and install. Set the waste end aside for later.
6. Select a new set of materials. If the cut-off waste from the first row was 18” or longer it can be used as the first board in the row. Maintain 6” spacing between the end joints of all rows.
7. Place a continuous bead of glue along the inside bottom edge of the END groove and the same location on the side groove. Carefully align the tongue and grooves together and tighten the plank until all joints are snug. Remove any excess glue as before and temporarily hold the joints together using blue tape. Cut and install the final board in the row.
8. Continue in this manner until the first four rows are completed. This four-row area is the base for the balance of the floor installation. Perfect alignment is essential, as any variance will worsen as the flooring proceeds further into the room. Carefully inspect for proper alignment before the glue sets. Adjust as necessary.
9. Continue with the installation as above. Continue using tape to hold the joints together and wedges to hold the end joints in place. DO NOT walk on the finished floor during installation, as this will break the uncured glue joint. DO NOT roll the floor for the same reason.
10. Finish the final row by cutting the boards to fit, allowing 1/4” expansion space.
11. If a Starting strip was used remove it and replace with a row of materials that is properly edge glued as above.
STAPLE/NAIL INSTALLATION

NOTES
1. Do not cut short boards to finish a row. The leftover materials will be used for future starter boards. Short lengths cannot be used and will become waste.
2. Ensure that staple plate is clean and free from nicks.
3. Follow the maintenance guide provided by your stapler/nailer manufacturer.
4. When stapler/nailer not being used never place directly on the hardwood floor.
5. Check air pressure different subfloors and engineered flooring require different pressures.

STEP ONE STARTING MARK
1. The floor must be level. Level is within 3/16” in 10’ (5mm in 3m) and/or 1/8” in 6’ (3mm in 2m).
2. Install the first board making certain that the Tongue side aligns with the Starting Mark with the groove facing the wall. IT IS VERY IMPORTANT TO START STRAIGHT AND SQUARE.
3. Using 6d finish nails and a pneumatic finish nailer, nail the first board every 6-8” approximately ½” from the groove edge parallel to the starting wall. Nail the edge not the ends. Maintain ½” expansion space at all times. Ensure that nail head are close to the wall so they are hidden by the baseboards and quarter round.
4. “Blind” nail every 3-4” within the tongue side nail pocket at a 45° angle. Use 1¼” - 1½” fasteners, minimum 2 per piece and within 2” of each end.

STEP TWO BOARD INSTALLATION
1. Insert the end of the next board into the adjoining tongue or groove and force the butt ends tightly together. Fasten as above until all boards in the row are complete.
2. Cut to length a board that fits at the end of each row always allowing for 5/8” expansion space at the wall.
3. Continue adding rows in this manner, blind nailing the tongue side only until enough rows have been installed to make room for the “blind” fastening machine. Avoid close alignment of joints in all rows throughout the installation, always attempting to get the maximum spacing available with a minimum of 6”. Avoid alignment of joints in opposite rows, which may create an “H” pattern in the floor.
4. Working from several cartons “rack” an area of the floor by loosely laying materials side by side in a pleasing pattern avoiding close joints.
5. Install the area using cut pieces from the end as starter boards for the next rows to reduce waste.

STEP 3 COMPLETING THE JOB
1. Inspect for gaps, chips and adhesive residue while removing the tape. Touch up chipped areas and fill with the appropriate filler as necessary. Use colored latex filler.
2. Install/reinstall all moldings and clean the floor with the appropriate cleaner. Use only a cleaner designated specifically for prefinished floors.

Continue in this manner until the entire floor that can be installed with the “blind” nailing machine is complete.
6. Using 6d finish nails or a pneumatic finish nailer blind nail and face nail the final rows. A recommended urethane adhesive can also be used to install the final rows.
7. Measure the final row. Rip the boards (parallel cut) to fit the final wall allowing for ½” expansion.
RADIANT HEATED SUBFLOORS
- Prior to any installation the slab must be cured naturally. See the timeline chart and checking for moisture content for further information.
- Always check for subfloor moisture prior to installing.
- Make sure all testing of system functions has been completed and you are approved to start installation.
- Insure that the shear strength of the glue does not exceed the strength of the adhesive. Light weight concrete (less than 3000 psi) will not be strong enough for a glue down application only for a floating application.

SYSTEMS ABOVE RADIANT HEAT
1. Plywood with vapor barrier is recommended for all applications glue, float and staple over radiant heat.
2. If directly over concrete it is possible to have two layers of plywood interlocking covered with a moisture barrier.
3. Direct nail to subfloor with floor joists. The plywood is screwed and glued into place on the floor joist which the radiant heating system is installed. The vapor barrier is between the floor and the subfloor.
4. Direct nails to subfloor over sleepers/installation

WITH RADIANT HEATING IT IS EXTREMELY IMPORTANT THAT THE RELATIVE HUMIDITY STAYS BETWEEN 45-55%, NEVER GOES BELOW 35%, AND THAT THE SUBFLOOR TEMPERATURE DOES NOT EXCEED 81F (27C). TYPICALLY A HUMIDIFIER AND DEHUMIDIFIER WILL BE NEEDED.

IN ADDITION TO THESE POINTS PLEASE READ THE INSTALLATION PROCEDURES FOR THE TYPE OF INSTALLATION YOU PLAN TO DO OVER THE RADIANT HEAT

GLUE DOWN
Radiant Heat Glue down Installation NWFA Installation Guidelines
- DO NOT GLUE DOWN ANY FLOORING DIRECTLY TO THE EXPOSED RADIANT HEAT PIPING.
- DO NOT DIRECTLY GLUE DOWN ANY WOOD FLOORING OVER BRITTLE OR LIGHT WEIGHT CONCRETE.

FLOATING
Radiant Heat Floating Installation NWFA Installation Guidelines
Ensure that recommended glue that is used is suitable for floating over radiant heat.

Use of an underlayment pad is recommended. To ensure that it is suitable for under radiant heat it must be resistant to temperatures above 30 degrees Celsius or 85 degrees Fahrenheit.

NAILING
- The essential requirement in proper applications of wood flooring over radiant heated systems is to avoid penetration of the heating element. Be sure nails are not so long as to penetrate heating elements.

STARTING THE RADIANT HEATING SYSTEM
The heating system should be run at 2/3 of maximum output for a minimum of 2 weeks before hardwood installation to allow any remaining moisture to evaporate.
- Four days prior to installation, during installation and 48 hours after installation, the heating system needs to be reduced to a approximately 64 F(18 C)
- 2 days after installation gradually and for the next week raise the temperature to desired level
- The surface temperature of the subfloor should never exceed 81F (27 C)
- Most radiant heat systems do not have a humidification system. However, the relative humidity MUST BE MAINTAINED AT 35-55%. Add humidification to maintain this level and to ensure that the warranty conditions are met.
- Expect some seasonal shrinkage during the heating season.
Currently Appalachian flooring does not accept solid flooring installation of hardwood flooring over radiant heat. Engineered flooring is recommended with the exception of Jatoba, Hickory, Santos and Tigerwood.

Here are three simple rules to follow:

1. Low Temperature - Keep the subfloor temperature as low as practical while still heating the space.
2. Even Heat - Spread the heat in the subfloor as evenly as possible.
3. Acclimate - Make sure the subfloor and the wood flooring are normalized or acclimated to the finished room before the wood is installed. The subfloor or slab must be dry.

While temperature does not harm the wood, it does affect its moisture content. As the temperature goes up, the moisture content generally goes down. Heating the wood too much will cause it to shrink and gaps will occur between the boards. Once the temperature is lowered, the moisture returns and the gaps close up. This is why a humidifier may be necessary in the room.

In most climates, winter air is dryer than summer air. This can cause seasonal gapping between boards and will occur regardless of whether or not there is a floor heating system installed. If an indoor humidity control is not present, occupants should expect some seasonal gapping on any wood floor with or without radiant heating.

While cupping of boards can be a result of improper wood floor installation, it can also be a result of uneven heating of the floor. Low, even temperature distribution is the key to avoiding this problem.

A moisture barrier between the wood and the subfloor is a must over concrete or gypsum floors and recommended even over a wood subfloor. The barrier helps maintain an even moisture balance in the floor.
Plywood on slab

1. Ensure Concrete testing for moisture, level specifications and density are completed.
2. Cover the entire slab with 4-6 mil polyethylene film, overlapping 4-6" (10 to 15 cm) and taping the edges, or with Sika primer and allowing enough film to extend under the baseboard on all sides.
3. Verify that the moisture content of the plywood is 10-12% before starting the installation.
4. Install the plywood after the vapor barrier is in place. Loosely lay a nailing surface of 3/4" x 4" x 8" (19 mm x 1.22 m x 2.44 m) exterior plywood panels over the entire area, leaving a 3/4" (19 mm) space at the wall line and 1/4"-1/2" (6-12 mm) between panels for expansion.
5. Cut plywood to fit within 1/8" (3 mm) near door jambs and other obstructions where finish trim will not be used. Lay plywood diagonally across the direction of the finished floor to help prevent cracks along panel edges.
6. Fasten plywood to the slab with power-actuated fasteners, ensuring that the nails or pins penetrate the concrete at least ¾” securing the center of the panel first, the edges, using one fastener per square foot. Fastener should be driven with slight countersink. To be sure to “flatten out” the plywood, start at the center of the panel and work towards the edges. Ensuring Level within 3/16" in 10' (5mm in 3m) and/or 1/8” in 6” (3mm in 2m). Stanley Bostich, Porta-Nails, Aerosmith & ET&F Fastening are all examples of suppliers of the machines and nails/pins for this application. The tooling will depend on the age of the slab thus determining the PSI required to penetrate ¾” into concrete.
7. If plywood bowed it should be installed crown side up (frowning or edges touching and gap in middle when not fastened)
8. Ideally a double layer of plywood interlocking would be used

Flooring directly on sleepers

1. ON SLEEPERS, PLYWOOD IS RECOMMENDED ESPECIALLY FOR OPTIMIZING ALL LENGTHS IN GRADES, ADDITIONAL RISK OF NOISY FLOOR AND ADDITIONAL STRESS TO THE WOOD FLOORING THAT MAY RESULT IN STRESS CRACKS.
2. In a Screeds System (sleepers) use Flat, dry, preservative-treated 2" x 4" (5 cm x 10 cm) screeds in random lengths from 18" to 48" (0.5-1.2 m).
3. Begin by sweeping the slab clean then apply Sika Primer (may need to be modified depending on moisture testing of concrete).
4. Stagger joints and lap ends at least 4" (10 cm) and leave a 1/2" (12 mm) space between lapped edges.
5. Place them on 12 inch centers unless plywood is being used which 16 inch centers is acceptable.
6. Leave a 2 inch space between ends of space and base late on the wall to allow for expansion
7. Be sure 100% contact between screeds and slab. Leave a space of 3/4” (19 mm) between ends of screeds and walls with a continuous run of screeds at end walls.
8. Before installing the floor, loosely lay an additional vapor retarder of 4-6 mil polyethylene film over the screeds, overlapping the edges on top of the 2 x 4s.
9. Avoid bunching or puncturing the film, especially between the screeds. Nail the finished flooring to the screeds through the film.

Please note the vapor barrier system will depend on the concrete testing results as to which product will be needed for the application.
BOARD REPLACEMENT

Wood is a natural product and repairs during and after installation are normal. Using a touch up marker, wax filler, or putty filler to fix imperfections in the flooring is standard practice. In addition for the larger repairs a board replacement is a normal procedure during and after installation.

STEP ONE BOARD REPLACEMENT SELECTION
Individual wood flooring boards can be repaired/replaced in solid, engineered and parquet products without affecting adjoining boards. Always check the species to insure a proper match, (i.e. red oak, white oak, etc). Prefinished boards should be selected for gloss and color match.

STEP TWO REMOVING DAMAGED BOARD

- Removing the plank or strip on wood and concrete subfloors
- Make sure you have a replacement board.
- Set a circular saw to the depth of the thickness of the board to be removed.
- Make one cut inset 1/2” from groove side running from end to end on the board to be removed.
- Make a second cut inset 1/2” from tongue side running from end to end on the board to be removed.
- Make a third cut across the center of the board at a 30-45 degree angle from first long cut to second long cut.
- With a chisel cut completely through both ends at cut lines and lift out center of the board. The groove side piece can now be easily removed.
- Carefully remove nails or staples and side tongue piece. Avoid damage to adjoining boards.

Alternate method on wood and concrete subfloors
- Split board down the center and along the grain with chisel. Pry out pieces. Avoid damaging the adjoining boards.

Alternate method on wood subfloors only
- Drill a series of large holes across center and against grain of board to be removed. Avoid drilling too far into subfloor.
- Using a sharp chisel cut off the tongue of the board being replaced. Avoid damaging adjoining boards.
- Remove the board and trim the edges of the opening. Replacing flooring that has been nailed/stapled down. Clean all debris from the area.

STEP THREE BOARD REPLACEMENT

- Measure the opening and cut replacement board to size. Carefully test the new board against the opening for precise fit.
- From the back side of the replacement board, chisel off or cut lower half of its groove side and end match so that it will fit over the tongue of the adjoining boards in the replacement area.
- Carefully dry fit the replacement board. Coat tongue and groove with glue. If available, use a fast setting epoxy to coat the back of the board to avoid the use of nails (described below) in the repair.
- Insert tongue, then drive it into place, using a wood block and mallet. If adhesive has not been used to secure the board (as described above) to the subfloor drill pilot holes for nails at each end of board and along sides of long boards. Make holes smaller than the size of the cement coated nails.
- Sink nail heads with a nail set. Use color putty to fill holes and joints.

BOARD REPLACEMENT FOR FLOORING THAT HAS BEEN GLUED DOWN.

- Clean all debris and old adhesive from the work area. Repair subfloor if necessary. Measure the opening and cut replacement board to size.
- Carefully test the new board against the opening for precise fit.
- From the back side of the replacement board, chisel off or cut lower half of its groove side and end match so that it will fit over the tongue of the adjoining board.
- Dry fit the replacement board. Coat tongue and groove with glue. Apply adhesive to the back of the board or to the subfloor.
- Use a polyurethane adhesive sparingly to prevent the unit from rising after replacement is complete. Insert tongue, and then drive it into place, using a wood block and mallet. Do not use a PVA (carpenters glue) for this application.
ENGINEERED WARRANTY

Appalachian floors are manufactured by an experienced team that combines a passion for quality with a high level of technical expertise. Using the latest technology in wood flooring manufacturing and production, Appalachian floors are built to last and give you the mental peace that comes with buying a top-line product that you can trust implicitly.

Thus, Appalachian Flooring ltd. is proud to offer you the following Residential Warranty Program (hereafter referred to as the Warranty). The Warranty covers our line of pre-finished engineered flooring which have been installed following recommended installation guidelines, maintained according to recommended floor maintenance procedures (as outlined in the Appalachian Installation Guide and the Care and Maintenance Guide) and kept at a normalized level of humidity (between 40-60%).

Appalachian Flooring ltd. warrants that all of its products successfully meet established industry standards, as specified for each product category, as well as meeting our own high standards and are thus free from manufacturing defects. This warranty extends solely to the original purchaser of the floor, is non-transferable and applies only to residential or light commercial use. In this context light commercial use is defined as use in business offices or non-food service stores and thus excludes any other commercial or industrial use from coverage.

The warranty is valid for all Appalachian pre-finished engineered flooring with a mat finish manufactured after June 2007.

35 year EVERSHINÉ™ Warranty

Appalachian Flooring Ltd. warrants, to the original purchaser, that the EVERSHINETM UV cured surface finish, factory applied, on its Appalachian pre-finished hardwood floor will not wear through or separate from the wood for a period of:

Three (3) years from the date of purchase, when used under light commercial conditions, as previously defined, and this for all products manufactured after June 2007.

Thirty-five (35) years from the date of purchase when used under residential conditions, and this for all products manufactured after June 2007.

Appalachian Flooring ltd. does not recommend the use of American Walnut, American Cherry or Birch for light commercial use due to the low relative hardness of these hardwood species.

This warranty applies on the condition that regular and preventative maintenance have been carried out as recommended in this guide and in the Appalachian Care and Maintenance Guide.

The Finish Warranty excludes any indentations, scratches or surface damage caused by misuse, negligence, accidents, lack of proper maintenance, spike-heeled shoes, water, wet mopping, erosion, pebbles, sand, other abrasives, insufficient prevention and/or protection. In order to qualify the floor as defective, the surface wear must be readily visible (from standing height) and cover at least ten percent (10%) of the surface area. Gloss reduction is not considered surface wear.

Use of floor care products other than those especially formulated for use on hardwood pre-finished flooring may damage your floor and void the warranty. Check our Care and Maintenance guide for a list of approved products or ask your local Authorised Appalachian Dealer.

Lifetime Structural Warranty

Our high production standards and passion for quality allow us to offer you a lifetime warranty on the structural integrity of our pre-finished hardwood floors. Our products conform to our highest standards and are of superior quality and uniformity.

Appalachian flooring thus warrants its pre-finished hardwood floors against all defects in manufacturing, sorting and dye application. Additionally Appalachian Flooring guarantees that our products will remain free from defects as regarding their sizing, classification, lamination, assembly and structural integrity and this for the natural life of the original purchaser.

To file a claim

If you wish to file a claim under this Warranty Program, you must first contact your Appalachian Authorized Dealer where the original purchase was made.

A written notice of claim must be filed within the warranty coverage period, and no later than six (6) months after the first occurrence of the problem giving rise to your claim. Information verifying date of purchase and identity of the original purchaser as well as the original invoice, as proof of purchase, must be supplied to Appalachian Flooring or its representatives on request. The floor in question must have been purchased directly from an Appalachian Flooring Authorized Dealer and paid for in its entirety before a claim may be submitted. The purchase of Appalachian hardwood flooring from an unauthorized Appalachian dealer and/or via the Internet will automatically void this and any other manufacturer’s warranties implicit or implied.

Important! We strongly suggest that you keep your original invoice, together with the Appalachian Installation Guide and the Appalachian Care and Maintenance / Warranty Guide in a safe place as they may be required to submit a claim.

If your local Authorized Appalachian Dealer is unable to answer your claim, please contact us by registered mail at the following address:

Appalachian Flooring Ltd., Technical Service Department
450 rue de Rochefort, Cowansville, Québec, Canada J2K 3S7
Tel.: (450) 266-3999 – Toll free: 1-866-213-1110 – Fax: (450) 266-5343

Or by e-mail: info@appalachianflooring.com
In this case Appalachian Flooring Ltd. will be happy to send you a form to be completed and returned for further processing.

In any eventuality, Appalachian Flooring Ltd. reserves the right to have a designated Appalachian Flooring representative inspect the floor and remove samples for technical analysis within 30 days from the receipt of the written claim. Should Appalachian Flooring’s analysis prove that a portion of the floor is indeed defective, Appalachian will, at its sole discretion, repair the affected area or supply replacement material in the form of an identical or equivalent product.

**Warranty exclusions**

The Warranty does not cover indentations, scratches or damage caused by negligence, water, wet mopping, erosion, pebbles, sand, other abrasives, spiked-heeled shoes, insects, pets, misuse, abuse, accidents, natural wood fibre surface discoloration, extreme environmental conditions, failure to follow all manufacturer’s specific written installation instructions, poor workmanship by installer, improper maintenance, insufficient prevention and/or protection in kitchen workstations and underneath furniture, misuse or improper alterations of original manufactured products, damages resulting from the shifting of the building, or from defects in the base on which the floor is installed.

The Warranty does not cover indentations, scratches or damage caused by negligence, water, wet mopping, erosion, pebbles, sand, other abrasives, spiked-heeled shoes, insects, pets, misuse, abuse, accidents, natural wood fibre surface discoloration, extreme environmental conditions, failure to follow all manufacturer’s specific written installation instructions, poor workmanship by installer, improper maintenance, insufficient prevention and/or protection in kitchen workstations and underneath furniture, misuse or improper alterations of original manufactured products, damages resulting from the shifting of the building, or from defects in the base on which the floor is installed.

The Warranty does not cover indentations, scratches or damage caused by negligence, water, wet mopping, erosion, pebbles, sand, other abrasives, spiked-heeled shoes, insects, pets, misuse, abuse, accidents, natural wood fibre surface discoloration, extreme environmental conditions, failure to follow all manufacturer’s specific written installation instructions, poor workmanship by installer, improper maintenance, insufficient prevention and/or protection in kitchen workstations and underneath furniture, misuse or improper alterations of original manufactured products, damages resulting from the shifting of the building, or from defects in the base on which the floor is installed.

The Warranty does not cover indentations, scratches or damage caused by negligence, water, wet mopping, erosion, pebbles, sand, other abrasives, spiked-heeled shoes, insects, pets, misuse, abuse, accidents, natural wood fibre surface discoloration, extreme environmental conditions, failure to follow all manufacturer’s specific written installation instructions, poor workmanship by installer, improper maintenance, insufficient prevention and/or protection in kitchen workstations and underneath furniture, misuse or improper alterations of original manufactured products, damages resulting from the shifting of the building, or from defects in the base on which the floor is installed.

**DEMAND OR ACTION IRRESPECTIVE OF THE NATURE OF THE CAUSE OF ACTION, INCLUDING BUT NOT LIMITED TO NATURE OF THE BREACH OF CONTRACT, BREACH OF COLLATERAL WARRANTY OR TORT INCLUDING NEGLIGENCE OR MISREPRESENTATION.**

CERTAIN CONDITIONS, EXCLUSIONS AND LIMITATIONS SET OUT IN THIS WARRANTY ARE NOT PERMITTED OR EFFECTIVE IN SOME PROVINCES AND STATES, THEREFORE SOME OF THE CONDITIONS, EXCLUSIONS AND LIMITATIONS MAY NOT APPLY TO YOU. THIS WARANTY GIVES YOU SPECIFIC LEGAL RIGHTS AND YOU MAY ALSO HAVE OTHER LEGAL RIGHTS WHICH VARY FROM PROVINCE TO PROVINCE AND STATE TO STATE. IT IS THE RESPONSIBILITY OF THE CONSUMER TO INFORM HIMSELF OF THE LEGAL RIGHTS THAT APPLY TO HIS SPECIFIC SITUATION.

THE SOLE REMEDY PROVIDED HEREIN IS THE REPAIR, REFINISH OR REPLACEMENT, AT THE OPTION OF APPALACHIAN FLOORING LTD. OF DEFECTIVE PRODUCTS. IN THE UNLIKELY EVENT THAT APPALACHIAN FLOORING LTD. IS UNABLE TO CORRECT THE FAILURE AFTER A REASONABLE NUMBER OF ATTEMPTS, APPALACHIAN FLOORING LTD. WILL REFUND, IF REQUESTED, THE PURCHASE PRICE OF THE PORTION OF THE DEFECTIVE FLOOR ON A PRORATE BASIS. ANY ATTEMPT TO REPAIR, REPLACE, OR REFINISH THE FLOOR PRIOR TO APPALACHIAN FLOORING LTD’S INSPECTION AND AUTHORIZED REPAIR ACTIONS WILL VOID THIS WARRANTY.

NO DISTRIBUTOR, DEALER, INSTALLER, AGENT, SALESPERSON OR APPALACHIAN FLOORING LTD. SALESPERSON IS AUTHORIZED TO CHANGE OR INCREASE THE TERMS OR COVERAGE OF THIS WARRANTY PROGRAM.

Please note: Warranty issues concerning adhesion or adhesives should be addressed to the adhesive manufacturer. These issues are the sole responsibility of the adhesive manufacturer.
